

**ABSTRACT OF THE DISCLOSURE:**

Many luggage cases have included mechanisms for helping fold garments for the traveler to help minimize wrinkling and to aid packing. Such mechanisms have included straps, bars and devices for holding hangers on which the garments are to be folded and hung. This invention includes a kit (4) for holding the bar (22) for receiving the hook portions (H) of hangers well above a vertically oriented lid portion (2) of the luggage case (1) and attachment devices (27, 38, 37) that permit the user to remove and replace this support mechanism within the lid shell of the luggage case. Also provided is a hanger bar which is moved into the lid of the case to permit the clothing on hangers to be easily placed in the luggage case, but is easily removed for more conventional packing.
